Spring Professional Exam Tutorial v5.0

Question 08

Question 08 - What is the JoinPoint argument used for?

JoinPoint argument is an object that can be used to retrieve additional information about join point during execution. JoinPoint needs to be the first parameter of Advice, only in that case Spring Framework will inject JoinPoint into advice method.

Join Point is supported in following advice types:

- Before
- After
- After Returning
- After Throwing

Examples of information that you can retrieve from JoinPoint:

- String representation of Join Point
- Arguments of Joint Point (for example Method Arguments)
- Signature of Joint Point (for example Method Signature)
- Kind / Type of Joint Point
- Target / This object being proxied
